Whisper Large v3 performance analysis

2026-10-27T08:46:37.703375+00:00 · Seed 42 · Original recording splits

Main findings

Large v3 frozen combined-test accuracy: **97.89%**. Complete external accuracy: **82.19%**. These measure different domains. No external result was used to fit or select this model.

Protocol and provenance

Official multilingual Large v3 audio encoder, frozen throughout. A twelve-language classifier warm-start is expanded to fifteen outputs, copying hidden layers and original rows and initialising sam, niu and ton with seed 42. The original recording-based splits and previous balanced extension sample orders are retained. No speaker separation is claimed.

Encoder computation is float32 with TF32 disabled. Audio uses mono 16 kHz, a maximum ten-second centre crop, 128 mel channels, native thirty-second padding and mean/population-standard-deviation pooling over real tokens. The classifier architecture and training schedule match the Small study. Selection maximises combined development-set macro F1, breaking ties with class-balanced NLL. Joint temperature uses only FLEURS validation and Pacific calibration.

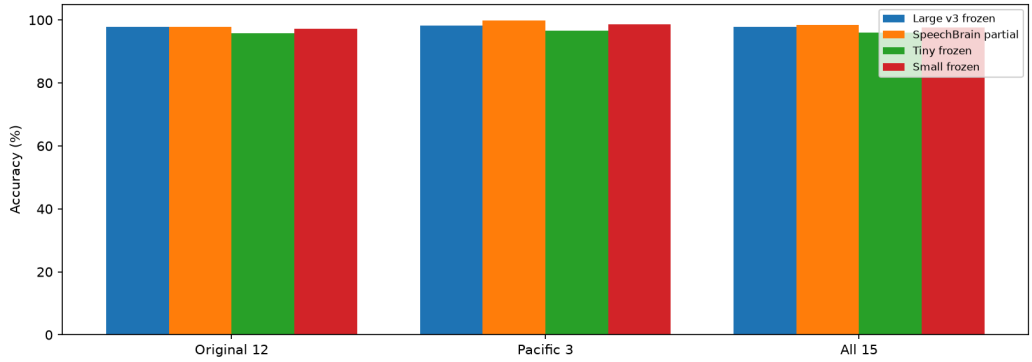

SpeechBrain partial updates its encoder tail; all three Whisper comparators here freeze their complete encoder. Pretraining data and architectures differ, so this comparison does not isolate model size as a causal factor. Larger pretraining does not guarantee better language identification.

reports/whisper_large_v3_15/figures/training.png

Checkpoint-selection history; external clips play no part in selection.

Original-language regression

baseline	delta_accuracy	delta_macro_f1	delta_nll	delta_brier	delta_ece
Large v3 twelve-language frozen warm-start	-0.0059	-0.0001	0.0207	0.0097	0.0003

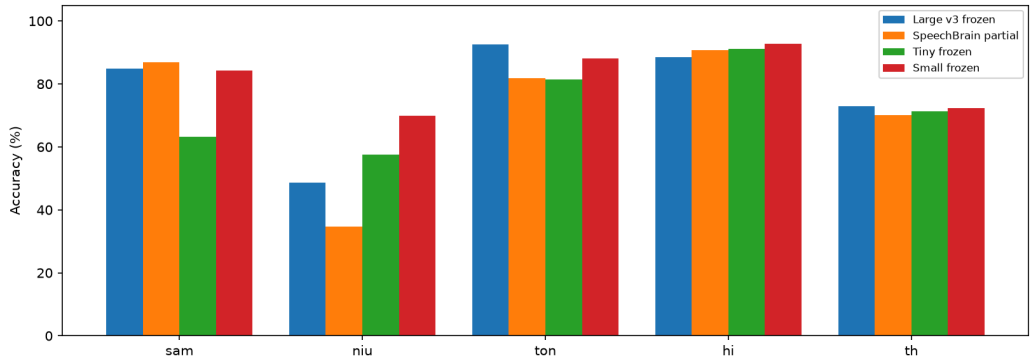

Both temperatures in this comparison use FLEURS validation only. All fifteen extension outputs remain enabled. No regression cutoff was imposed.

External validation and exclusion coverage

External folder labels remain provisional and may include English or code-switching. Shared-cohort results use one common English-exclusion mask across exactly the four compared models. Equal-source accuracy weights recordings equally. Historical and added Niuean recordings are reported separately.

Duration and selection-only gain probes

All models use identical diagnostic windows and gain inputs. Matched duration languages: ['hi', 'sam', 'th', 'ton']. No qualifying matched Niuean duration windows are available. Gain probes are restricted to checkpoint-selection cuts; positive gain is capped to avoid clipping. No external preprocessing tuning was performed.

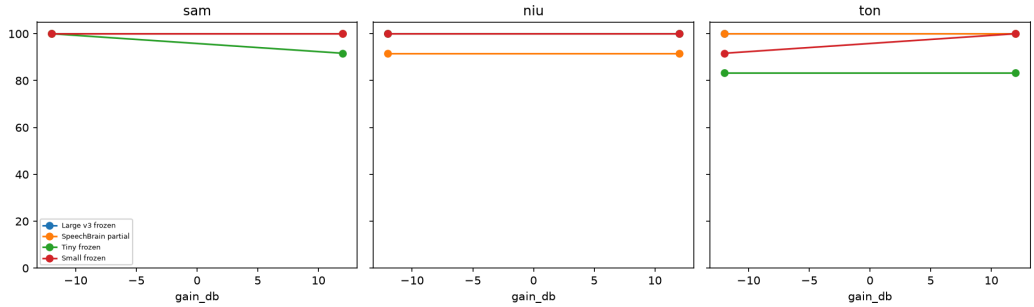

reports/whisper_large_v3_15/figures/duration.png

Deployment, resources and limitations

The decoder-free export loads offline using SpeechBrain EncoderClassifier.from_hparams. Joint calibration is folded once into the classifier. Relocated verification covers every test and external example, plus CPU/file and variable-length batch inference. Supported labels are bundled. VAD and unknown-language rejection are not included.

One seed and a small number of correlated external recordings limit conclusions. Recording-held-out partitions do not establish speaker independence. All runs enforce 4 GiB RAM, zero swap, two CPU threads and one GPU job below 7 GiB.
