Whisper Small15 performance analysis

Focused seed-42 study · Original recording splits · 2026-10-25 23:08 UTC

1. Main findings

> Whisper Small15 combined-test accuracy is **97.70% frozen** and **98.30% fine-tuned**. On the complete external corpus it is **84.13%** and **82.63%**, respectively.

The held-out difference is +0.60 percentage points; the external difference is -1.50 points. These are descriptive results from one paired seed, not significance tests or an externally selected deployment winner. Read original-language, Pacific and per-recording results separately before interpreting the pooled score.

Held-out and external cohort results. External references remain provisional directory labels.

2. Protocol, data and training

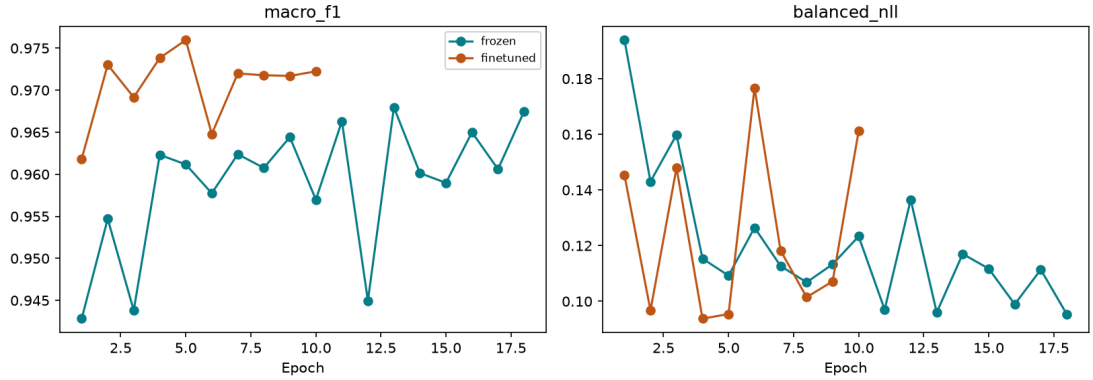

This focused rerun trains a frozen Small12 classifier as the warm-start, then two Small15 variants with identical initial weights and seed-42 class-balanced sample orders. It does not train native/filtered Small controls or a fine-tuned Small12 control. Classifier hidden layers and twelve output rows are copied from the selected Small12 head; sam, niu and ton are appended. Tiny parameters and embeddings are never reused as Small parameters or embeddings.

The original recording-based VoxLingua/Pacific splits are unchanged. The extension uses 32,768 sampled examples per epoch, effective batch 32, AdamW, classifier LR 1e-4, encoder LR 1e-5, weight decay 1e-4, maximum 20 epochs and patience 5. Selection maximizes combined fifteen-class macro F1 with class-balanced NLL as tie-breaker. The warm-start instead uses original VoxLingua validation NLL and the original weighted classifier schedule.

Audio is mono 16 kHz, at most ten real seconds by center crop, padded to Whisper's native thirty-second window. Pooling uses real-token mean and population standard deviation. Small's decoder is omitted from classifier training and deployment. Fine-tuning updates the whole Small audio encoder; SpeechBrain partial15 updates its encoder tail.

Joint calibration uses FLEURS validation plus Pacific calibration only. External clips never enter training, selection, calibration fitting or preprocessing tuning. Recording splits do not establish speaker independence.

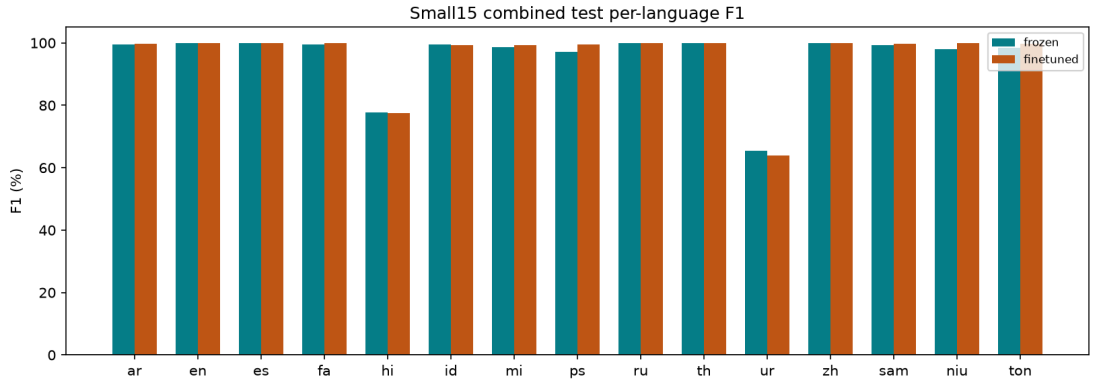

Selection histories; checkpoint choice uses these development metrics only.

Selection and calibration are development cohorts, not independent test results. All fifteen outputs are enabled in every subgroup. Macro metrics average represented reference classes: twelve on FLEURS, three on Pacific and fifteen on the combined test.

Combined-test per-language F1; the complete confusion matrices appear in the plot appendix.

All systems use the same held-out IDs. Backbone pretraining and update policies differ; these are system comparisons rather than a controlled causal test of encoder depth.

Small15 variant	Baseline	Δ accuracy (pp)	Δ F1 (pp)	Δ NLL	Δ Brier	Δ ECE (pp)
frozen	frozen Small12 warm-start	-0.28	-0.23	+0.0077	+0.0038	+0.22
finetuned	frozen Small12 warm-start	-0.08	-0.16	+0.0101	+0.0020	+0.42

These comparisons fit temperature on FLEURS validation alone and retain all fifteen extension outputs. Frozen15 versus frozen12 measures extension regression with a fixed encoder. Fine-tuned15 versus frozen12 combines encoder adaptation and vocabulary expansion; no matched fine-tuned Small12 regression is available.

The unchanged v4 snapshot has 24 sources and 1,336 segments, including 1,243 historical and 93 added Niuean segments. Labels are provisional directory labels. English predictions can reflect genuine code-

switching. English-excluded scores remove each model's own English predictions. Shared-cohort scores use all six extension models listed below; this cohort may differ from the earlier Tiny-only report and is explicitly recomputed for Small comparisons.

Language-level results distinguish Pacific transfer from Hindi/Thai recognition. Twelve-language controls are out-of-set diagnostics for Pacific audio.

7. Duration and volume diagnostics

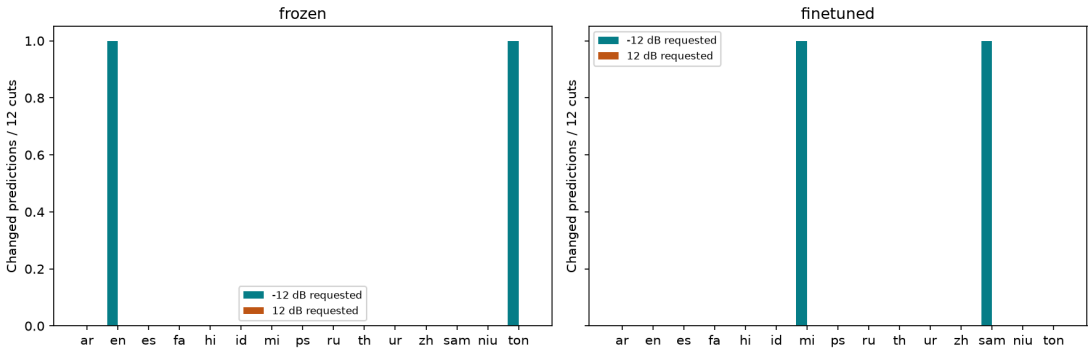

Duration diagnostics reuse exactly the same nested 3/5/10-second windows as Tiny and SpeechBrain. They are a subset of the external corpus, not the full segmentation. Missing matched duration languages: **niu**. A language absent here has no qualifying ten-second VAD region; no duration estimate is fabricated.

Matched-duration all-window accuracy. Small window counts and correlated sources limit interpretation; longer audio need not improve every recording.

Volume probes use twelve checkpoint-selection cuts per language, never external audio. Positive gain is capped to avoid clipping. Results are descriptive probes, not a reason to tune preprocessing on the external corpus.

Variant	Requested dB	Applied mean dB	N	Changed	Accuracy before	Accuracy after	Mean |Δ confidence|
whisper_small15_frozen	-12	-12.0000	12	0	100.00%	100.00%	0.0022
whisper_small15_frozen	12	10.3842	12	0	100.00%	100.00%	0.0067
whisper_small15_finetuned	-12	-12.0000	12	1	91.67%	100.00%	0.0122
whisper_small15_finetuned	12	10.3842	12	0	91.67%	91.67%	0.0206

Selection-only gain probes; actual positive gain varies across recordings because of the clipping cap.

8. Deployment, resources and limitations

Variant	Archive	Size	Verified N	Top-1 differences	Max |Δ log p|
frozen	artifacts/deployment/whisper_small15_frozen.tar.gz	199.90 MiB	14400	0	9.54e-06
finetuned	artifacts/deployment/whisper_small15_finetuned.tar.gz	313.82 MiB	14400	0	3.62e-05

Both architecture-correct decoder-free bundles load through SpeechBrain EncoderClassifier.from_hparams, include fifteen labels and have joint temperature folded once into the classifier. Each was verified offline after relocation against every test and external example, plus CPU/file and padded-batch inference. VAD and unknown-language rejection are not bundled.

```
from speechbrain.inference.classifiers import EncoderClassifier
model = EncoderClassifier.from_hparams(
    source="/path/to/whisper_small15_finetuned",
    savedir="/tmp/whisper_small15_loaded",
    run_opts={"device": "cpu"},
)
log_probs, score, index, labels = model.classify_file("audio.wav")
```

The guard enforces 4 GiB host RAM, zero swap, two CPU threads and a single GPU job below 7 GiB. The encoder-only preflight verifies a full optimizer step and checkpoint save before the long run. This is one seed and 24 provisionally labelled external sources. Segment counts do not establish independent speakers or statistical significance. No model is automatically chosen from external performance.
